

Design Overview  
John Buchanan, PhD  
University of Tennessee

The design of subsurface drip dispersal system is based on one number – the loading rate. Once a loading rate is established, then the remainder of the design is hydraulics. This session will assume that a loading rate has been established and that we need to design the hydraulics. We will discuss drip irrigation technology, spacing of emitters and laterals, selecting the components, and designing the system to be maintenance-friendly.
