

# Drip Distribution Research in Texas

Dr. Bruce J. Lesikar  
Texas Cooperative Extension

22<sup>nd</sup> Annual On-Site Wastewater Treatment  
Conference: Advances in Systems,  
Standardization and Technology  
April 24 -26, 2006

# Subsurface Drip Distribution System

# Why Drip Distribution?

- Uniform application of the effluent.
- Control application rate.
- Shallow soil
- Steep slopes
- High groundwater
- Full use of landscape area.
- Reuse wastewater in the landscape.

# Wastewater Treatment Approach

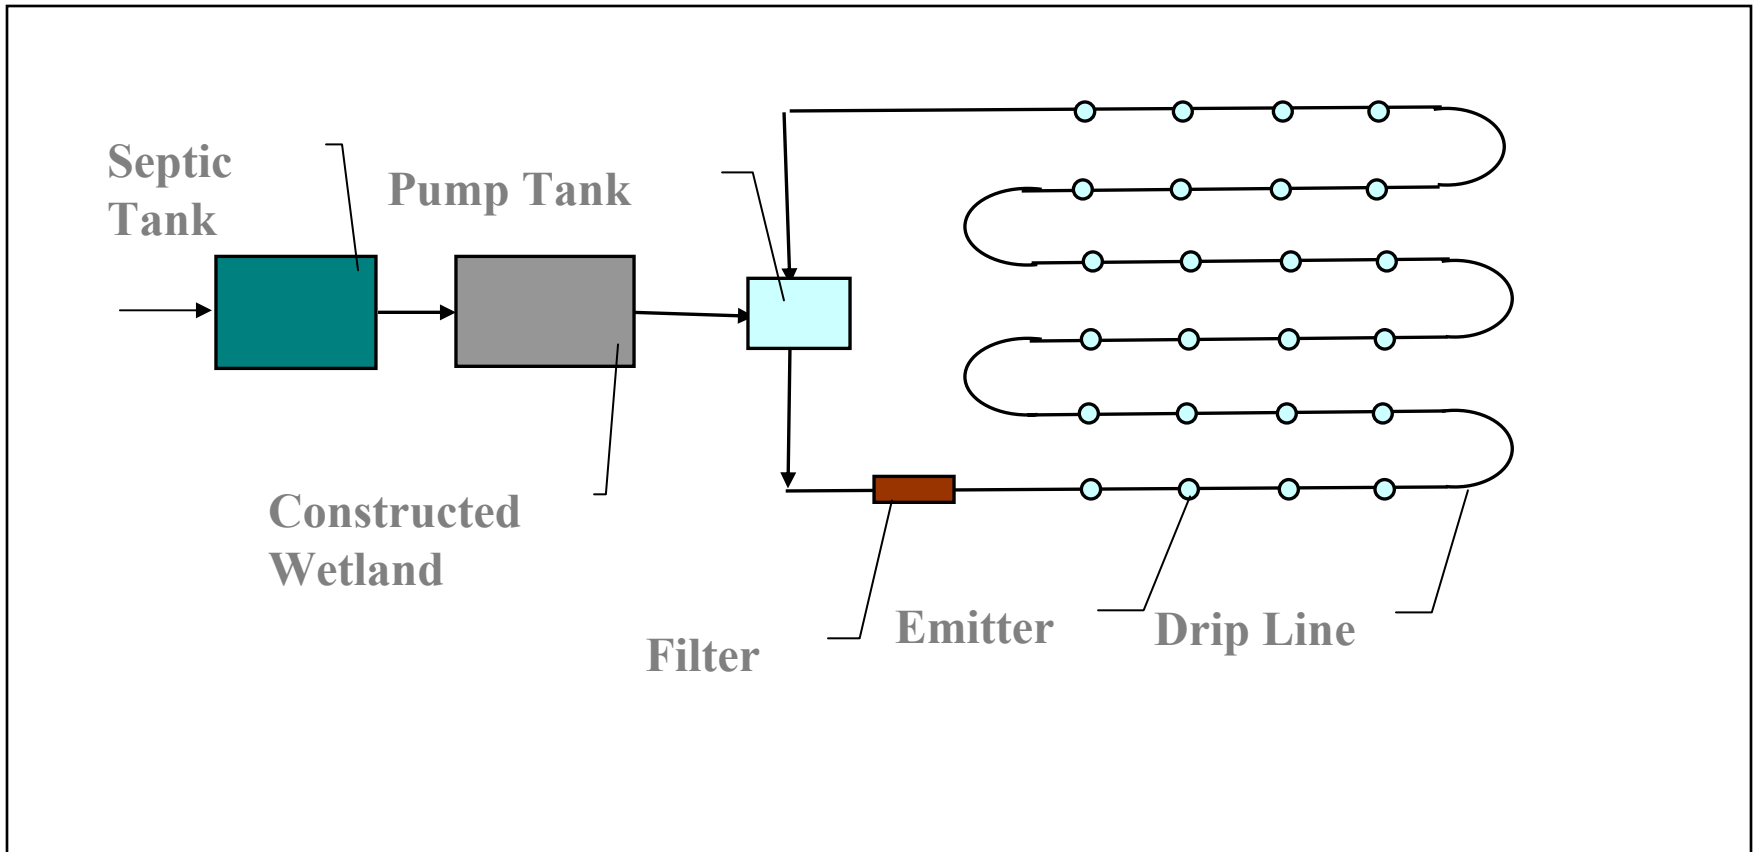

- Small doses of wastewater into the soil.
- Wastewater moves through soil under unsaturated flow conditions, thus effectively treating the wastewater.
- Wastewater can be dosed into the active surface layer of the soil.
- Maximizes reuse of nutrients and water.

# *Objective*

Conduct a field study to characterize changes in soil hydraulic properties caused by application of septic tank effluent through subsurface drip systems.

Laboratory evaluation of water movement around an emitter.

# *Site Description*

# Wetland Pretreatment System

# Weslaco Subsurface Drip Fields

# *Operation Data*

---

Emitter Flow Rate, liters/hr	Average Application Rate , liters/day/m <sup>2</sup>	Emitter Depth, cm	System Operation , year
3.4	1.83	7.5	6

---

# *Applied Effluent Quality*

---

Constituent	Average
TN (ppm)	29.2
P (ppm)	0.6
K (ppm)	28.5
Ca (ppm)	113.0
Mg (ppm)	31.6
Na (ppm)	305.0
SO <sub>4</sub> (ppm)	280.2
Cl (ppm)	199.0
HCO <sub>3</sub> (ppm)	578.0
COD (ppm)	76.1
NH <sub>4</sub> (ppm)	30.9
BOD <sub>5</sub> (ppm)	23.0
Fecal (cfu/100ml)	22777
EC ( ds/cm)	1.2
SAR	6.5
PH	7.2

---

# *Soil Sample*

- Seven replicates of undisturbed soil cores 7.6 cm diameter by 7.6 cm long were obtained from three different locations and from three different depths around the drip emitter

# Collecting Soil Samples

# *Location of the Soil Samples*

# *Soil Core Sample Tests*

- Hydraulic conductivity was tested using constant head method, and
- Soil retention curve was determined using pressure cell method.

# *Pore Size Distribution*

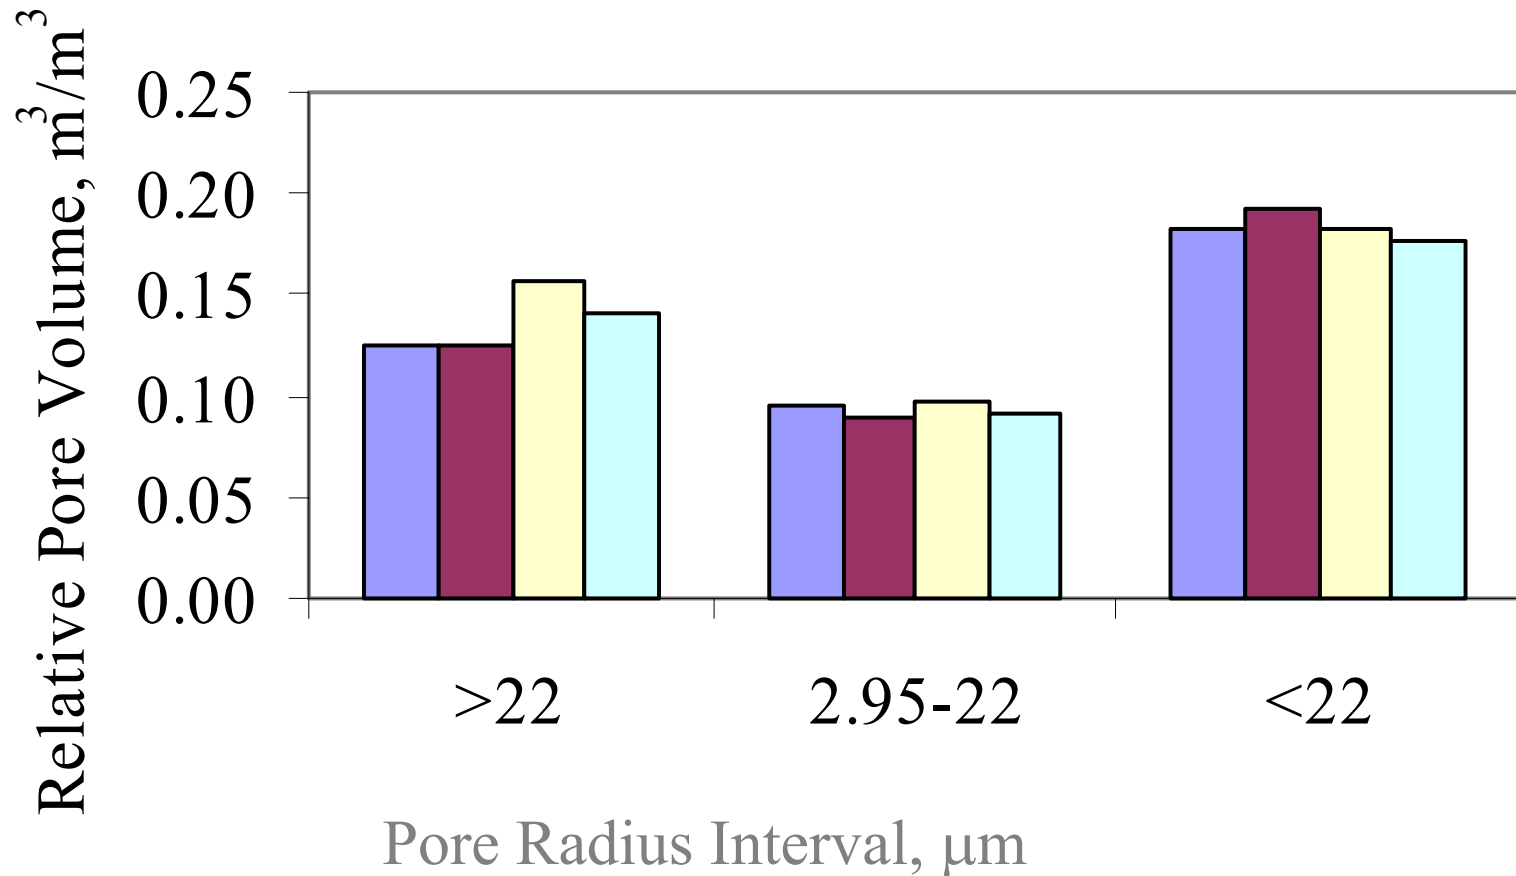

- Pore size distribution was determined from retention data using the following equation:

$$r = \frac{2 \sigma \cos \varphi}{h \rho g}$$

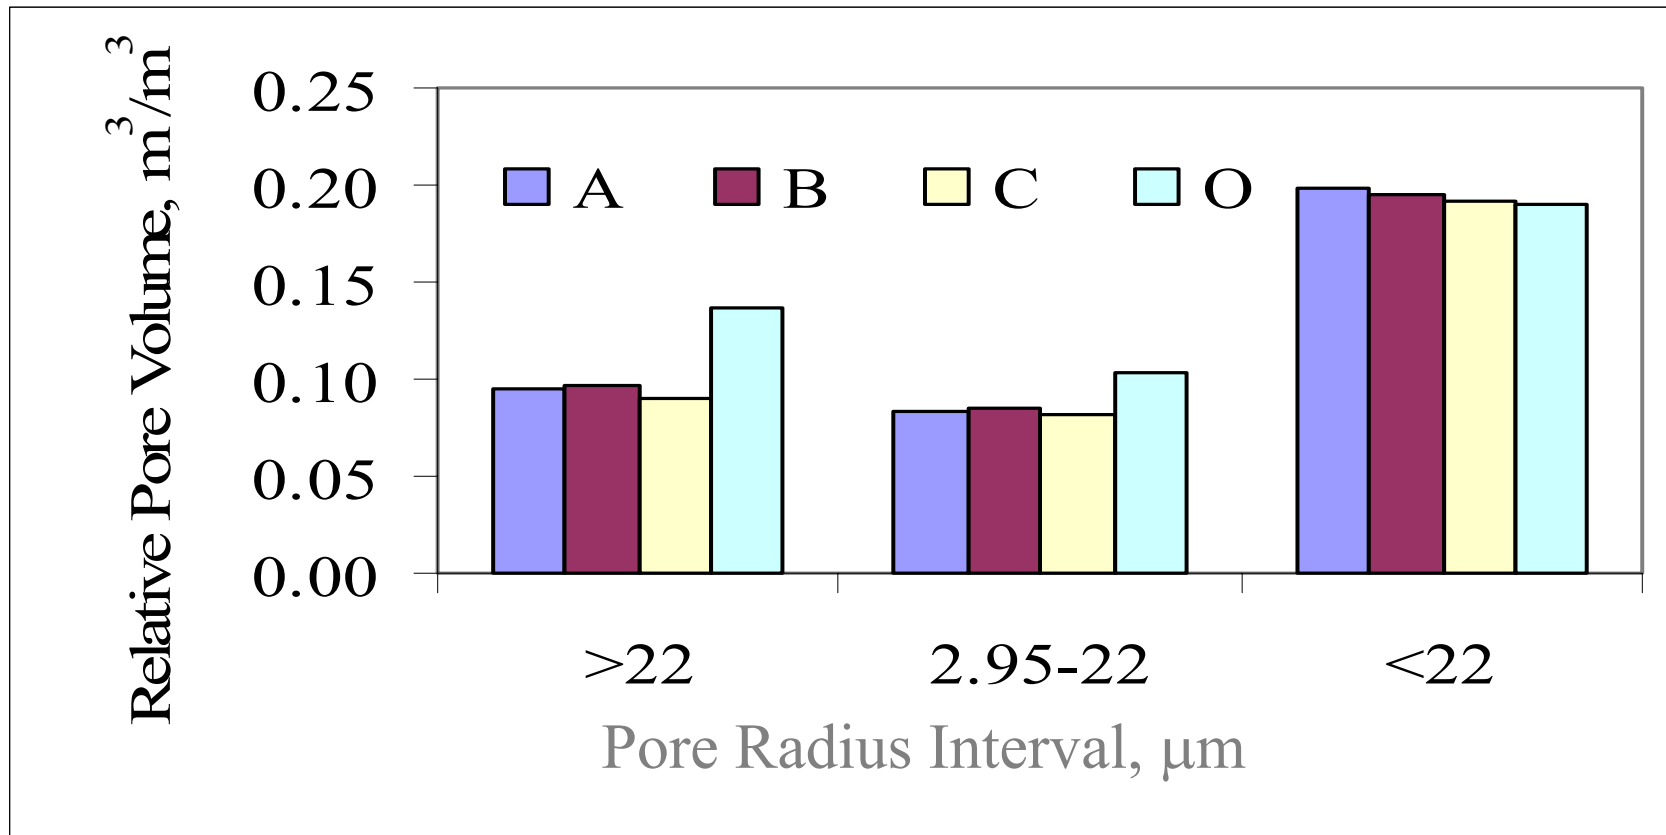

- $r$  is the mean pore radius,  $h$  is the capillary potential,  $\sigma$  is the water surface tension,  $\varphi$  is the contact angle between liquid and solid,  $g$  is the acceleration due to gravity, and  $\rho$  is the density of water.

# *Results of Soil Hydraulic Properties Analysis*

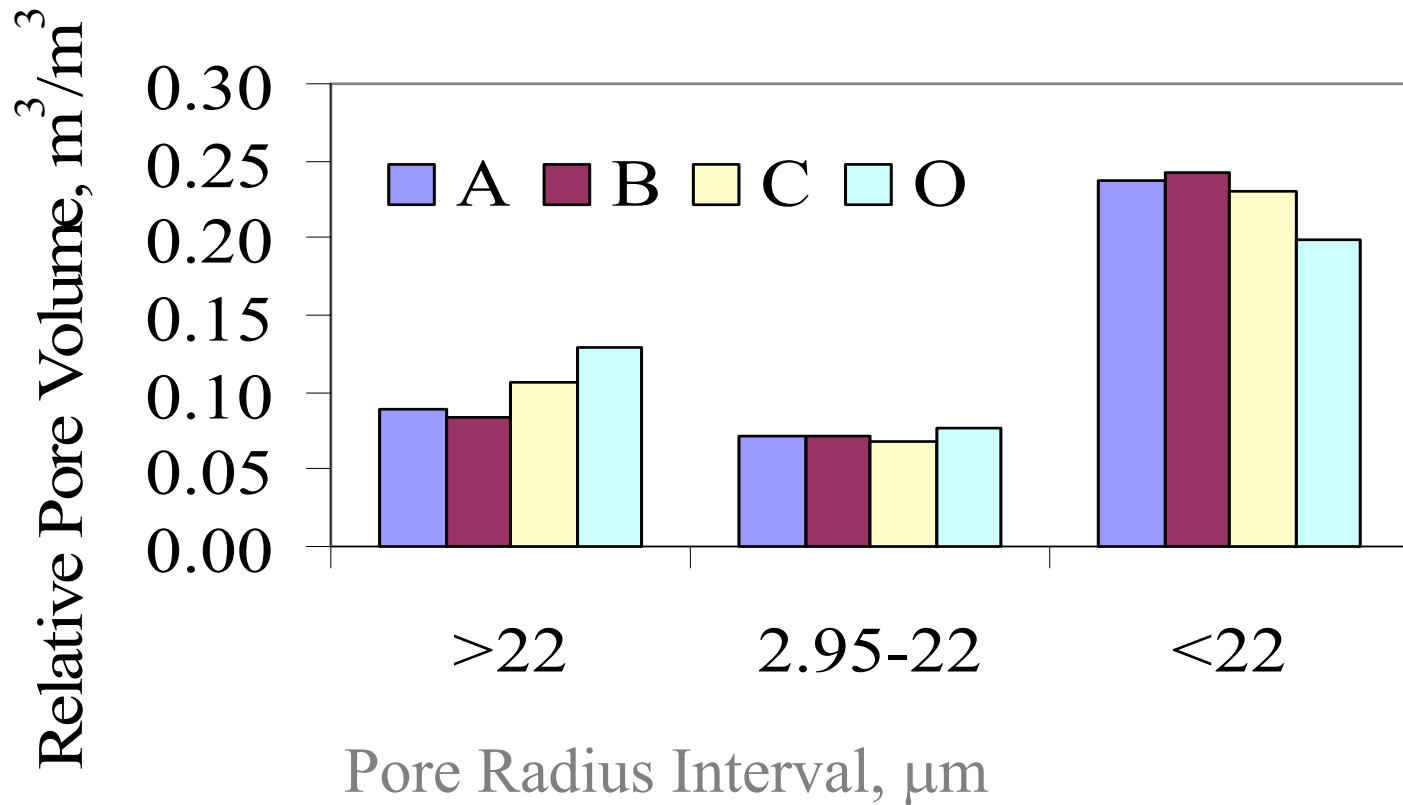

# *Pore Size Distribution at 3 cm Above the Emitter*

# *Pore Size Distribution at 7 cm Below the Emitter*

# *Pore Size Distribution at 30 cm Below the Emitter*

# *Change in the Concentration of Selected Chemicals in the Irrigated Area Compared to That in the Control Area (%).*

Constituents	Location		
	A	B	C
<i>At 3 cm above the emitter</i>			
Na	247	165	237
Ca	2	-5	2
Mg	97	87	187
TOC	7	3	3
<i>At 7 cm below the emitter</i>			
Na	500	450	475
Ca	-19	-38	-49
Mg	59	32	23
TOC	-6	-5	-20
<i>At 30 cm below the emitter</i>			
Na	418	600	380
Ca	-60	-42	-70
Mg	-25	246	76
TOC	-85	-47	-43

# *Saturated Hydraulic Conductivity*

# Laboratory Hydraulic Study

- Soil bins packed with loamy fine sand.
- Water measurement using tensiometers and TDR sensors
- Application of effluent at  $0.2 \text{ g/ft}^2\text{-d}$
- Effluent applied to soil through drip emitter for 103 days and then additional 70 days.
- Stopped effluent application to determine water movement pattern: dried soil, turned on pump and applied water through  $0.62 \text{ gph}$  emitter for 180 minutes continuously

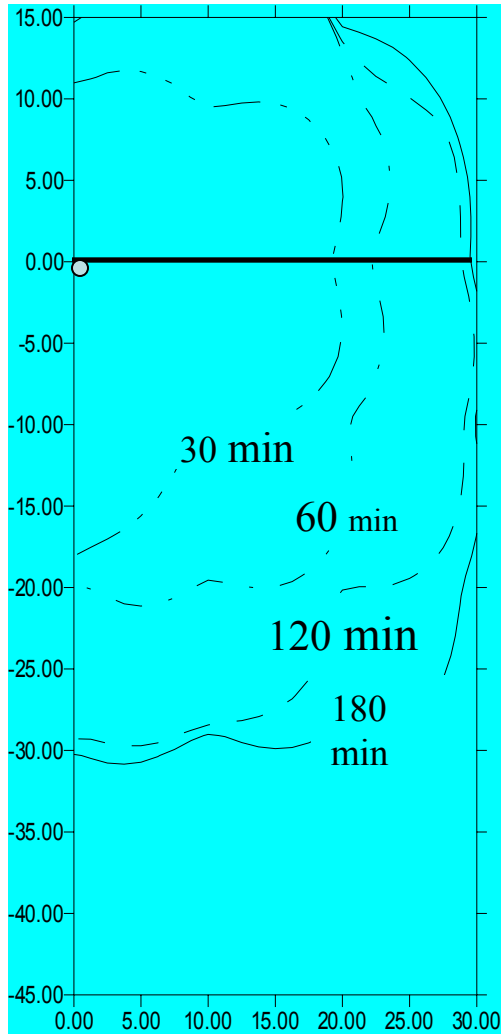

# Laboratory Study Apparatus

# Soil Moisture Sensors

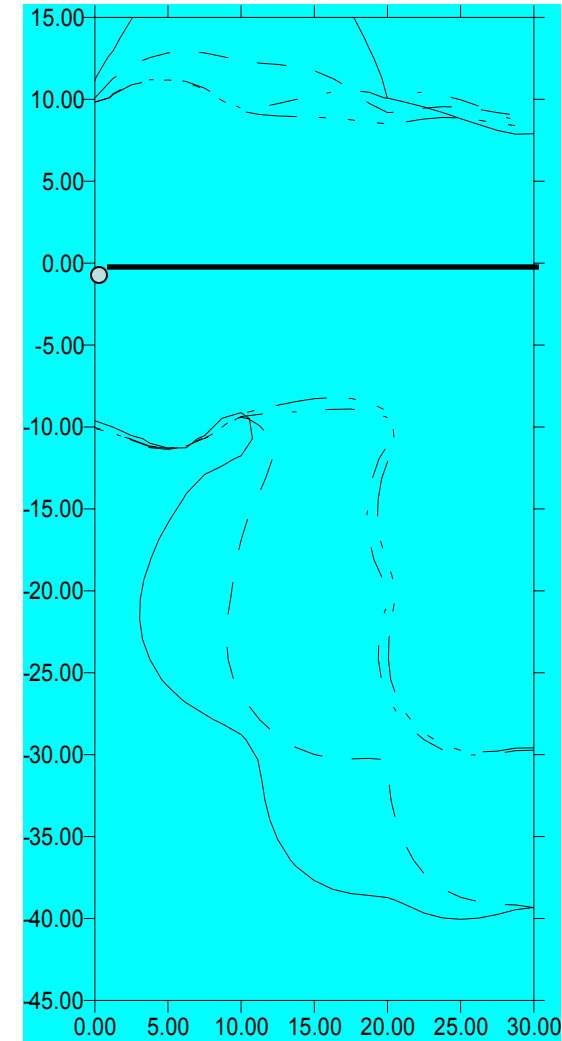

# Water Movement From An Operating Drip Emitter

**Horizontal distance, cm**

**Horizontal distance, cm**

**Horizontal distance, cm**

# Hydraulic Study Discussion

- Lower conductivity below the emitter.
- Water movement below emitter is hindered
- Water moving along the drip lateral.
- After relatively long emitter run time, water moving toward surface

# Vegetation Response in Drip Fields

# *Conclusions*

- Application of treated effluent resulted in increased soil water retention, decreased volume of pores with large radii, and decreased saturated hydraulic conductivity.
- The major influence of applied effluent on soil hydraulic properties occurred in the area below the emitter.
- The impact of treated effluent on soil hydraulic properties decreased with increasing distance from the emitter.

# *Conclusions*

- Sodium could be a major factor in altering soil hydraulic properties.
- The subsurface drip field did not exhibit a severely clogged layer similar to those associated with a biomat in a conventional septic system.
