

Pump Overview:
Darren Meyers,
Zoeller, Inc.

Many options exist for choosing a dosing pump for an onsite application. Factors such as material, components, tolerance, and workmanship are all things to consider when selecting a manufacturer. Many good options exist. But even the best pump may fail prematurely when placed in the wrong application. Choosing the wrong type of pump, poor installation practice, or incorrect settings can all negatively affect the life of these vital system components. Incorrect pump selection and sizing are likely the greatest causes of early failure within a designed onsite dosing system. Education and understanding are the keys. Armed with the right knowledge, the process of proper pump selection and sizing needn't be a challenge.
